

Efficiency On Tap: a case study on crafting a custom channel for brewery success

Case Study: Revitalizing a firehouse into a microbrewery with custom floor drainage solutions

Requirement:

This microbrewery needed floor drainage that could be custom made to fit around their brewing equipment, and manage high flow rates and even higher temperatures. Long-lasting quality was key for this fast paced, pedestrian heavy environment.

Solution:

BLÜCHER facilitated the design of an L shaped channel in grade 304 stainless steel, complete with a mesh grating. This bespoke channel allows ease of access to all the brewing tanks within the area, without comprising on flow rate or heat resistance.

Result:

The installation of the custom L shaped channel has met the unique requirements of the customer. With its ability to handle high flow rates, withstand high temperatures, fit seamlessly into the brewing setup and endure pedestrian traffic, the brewery is now fully prepared to withstand day-to-day brewing operations.
