

Back Box Repair Clip has been designed to replace a damaged thread or lug on the inside of a metal electrical back box.

This award winning, innovative solution is eco friendly, calibrated, tensioned and offers faceplate levelling capability. After removing the damaged lug, the clip simply pushes on and remains firmly and securely in place. Within minutes the box is repaired, saving you time and additional cost of repairing plaster, tiles and any decoration.

Check out the strength test of the clip on our website, independently carried out by Arena Training Sheffield!!!

BACK BOX REPAIR CLIP

INSTALLATION INSTRUCTIONS

- Ensure power is isolated.
- Remove the face plate.
- Remove the damaged lug and if the box is twisted out of shape, straighten to ensure the box side is once again at a 90° angle. **Ensure any snags from the old lug are fully removed, so the repair clip cannot foul when being positioned.**
- Using a sharp tool, scrape away any plaster or adhesive from the outside edge of the box in the area where the clip is to be located, so the back of the clip has room to be inserted.
- Position the clip by hand, then using the nose of a set of pliers or suitable tool, gently push the clip in to place. **Do not hammer or strike the clip, as this could affect its durability.**
- Screw the face plate back to the wall. **Do not over tighten!**
